SNHU

Module 2

These are my four objects that are for my milestone. The scenes depicted were taken on my iPhone arranged in such a manner that allows their appearance to be seen more individually. These items are important to me because the dinosaur represents the ability to speak to another person with the intent of understanding the problem you are facing. It's called rubber ducking in the software engineering world where you speak about a problem out loud in hopes of triggering another viewpoint in your brain. There is an alarm clock that is important as well as being punctual is ninety percent of life. And there is a wireless mouse and a MacBook Air which I use for studying at the library. The most complex shape is the Dino that is cylindrical and has a boxy rectangular body with a long neck and big snout. The MacBook is a thin box with tapered edges that are very sharp and subtle. The alarm clock is a simple box but has many buttons on the top of it making it a complex figure to capture the essence entirely. The wireless mouse is not as complicated because it was the same rectangular configurations with smooth edges making it another stepping stone towards mastery of shapes.

The shapes detailed by these figures seem easy but necessitates the use of smooth edges creating difficult shapes that aren't a circle like a torus like the brim of a coffee cup or tea mug. The changing dimensions in each object will highlight the differences in approaches used in creating each shape individually while all of them having the same characteristics. Putting all these shapes together will take careful planning and hopefully simple decision making because I believe with just a rectangle and a few smooth edges I can recreate the bevels and the iconic look

of these products. I almost forgot that the headphones are also a rectangular box shape with smooth edge. It has a line denoting that it is two distinct parts of a whole with a groove for your finger to pull open. Revealing the AirPods within, all these shapes will require different types of shapes from ovals to long ovals to being just an edge piece or a simple square for the buttons on the alarm clock.
